#### **CLIMATE CHANGE ISSUES**

Life depends on the warmth of the sun beams trapped by layers of gases that surround the earth

We now produce so much of these heat-trapping gases that the layer is getting thicker heating the world, changing our climate and threatening our way of life.

As the world gets hotter the climate will change and some of the extreme effects we have witnessed will become more frequent making our planet a more hostile place to live.

If we could see the gases the cause of the problems would be obvious to everyone.

And if you could see the effects we're having on our planet you'd do something about it.

The solutions exist and it's not too late to make a difference, but we have to act now, today.

Governments, industries and individuals acting together to tackle the problem
